

the outboard corners are pulled apart; the machine is now the shaped conventional tokamak

-
- The diagram illustrates the geometry of a tokamak. On the left, a green hatched rectangle represents the central solenoid, with a vertical dashed line indicating the symmetry axis. To the right, a poloidal cross-section in the R - Z plane is shown. This cross-section is bounded by a dashed blue line representing the major radius R_0 . Inside, a solid black line represents the plasma boundary, with a radial displacement δa from the center. A pink shaded region represents the plasma core, with a radius a . A dashed pink line indicates the magnetic flux surface B_ϕ . The poloidal current I_p is shown as a red circle with a dot. The safety factor κa is indicated by a vertical double-headed arrow. A blue arrow points to the center of the plasma core, labeled c : to be derived (§47-48). A wavy blue line with a box at the end represents a perturbation or wave. Various symbols (squares, circles, crosses) are placed around the cross-section, likely representing different physical quantities or components.

Idealized schematic; not a fabrication drawing.
 $R_0/a=3.0$, $\kappa=1.70$, $\delta=0.40$, 6 of 12 TF coils in the 3-D panel; all geometry computed by tokamak build.py.
